

Exercise Week 9 – Changing Styles with the The DOM

Change styles with the DOM

1. Change 3 separate HTML elements using the DOM. Pick any 3 elements you like (eg, paragraph, a heading, an input box, etc. Create a button for each change.

The example shown below is using 3 headings - you can do the same as this if you wish, or use different elements if you prefer.

Each button should make one change to one of the items - For example, clicking the button "Change the first heading" might make the first heading font color red.

This is the first heading

This is the second heading

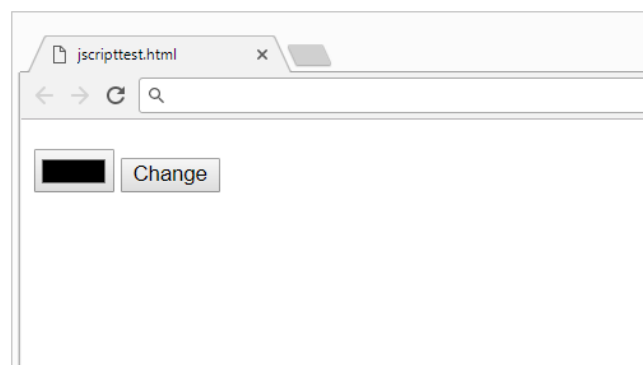

This is the third heading

Change the first heading

Change the second heading

Change the third heading

2. Create a page similar to the following, with a colour picker and a button. The picker should allow a user to pick a colour, and clicking the button will change the page background to that colour.

NOTE: To add a colour picker to a page, use the INPUT tag:

```
<input type="color" id="colpick">
```

To determine what colour has been chosen in the colour picker, you can use a DOM query of the value of the element, eg:

```
document.getElementById("colpick").value;
```

To change the background colour of a page, the following can be used:

```
document.body.style.backgroundColor
```
